

## DECLARATION

Salt, or sodium chloride, is an essential mineral needed by the human body (and all animals) in order to function properly.

Salt, a natural ingredient found in both land and sea has been there since the beginning of time.

Salt is chemically stable. It doesn't expire. It doesn't degrade or become stale.

Salt is a preservative used to extend the shelf life of other products.

However, its "free-flowing, usable life can be limited by caking or lumping of salt crystals due to moisture."

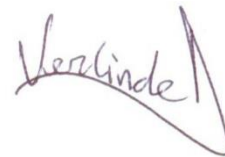

Sale or consumption of the product after the expiry date is at own risk.

VERLINDE DELPHYN
